

"Flappy Roll"

This time I based my inspiration in the real Flappy Bird and then added a twist. The idea is that you need to stay between two bands (top and bottom), they represent the flotation bands used in Argentina to contain the dollar.

As always, this is the top of the iceberg, in this project you will find references to motivation, tribute and a mini framework to make your own games in javascript, I like to call it "my version of SPA, using canvas".

Enjoy at

mfontanadev websie: <https://mfontanadev.github.io/games/FlappyRoll/index.html>

Motivation

- Push myself to start creating videos about videogame development.
- Tribute to filete porteño, you can see more about this and the artist's atelier in [Alfredo Genovese](#)

- Learn about color theory and bill dollar palette in [Scheme color](#)

- Learn about Google Fonts, take a look at [Milonga Font](#)

Making of

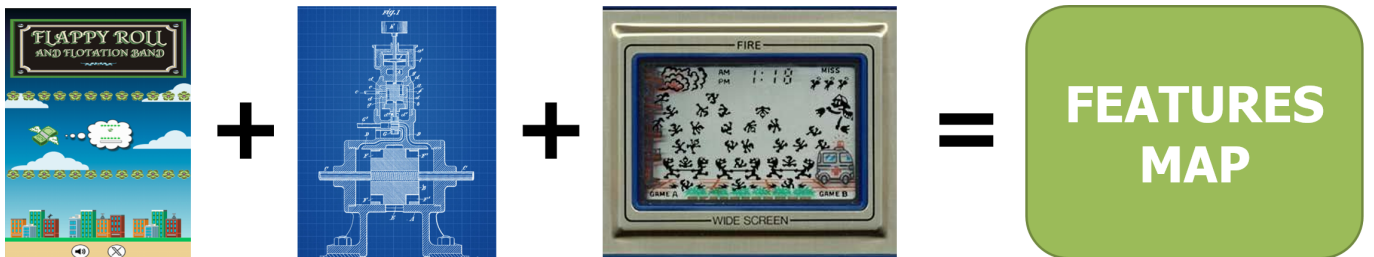

This section is about details of the development process.

Features map

An intent to summarize in one picture all the game features, this gives you an idea of where was all the time put.

But first, how that picture comes to life, as a merge between a patent prints and 80's LCD games reset mode.

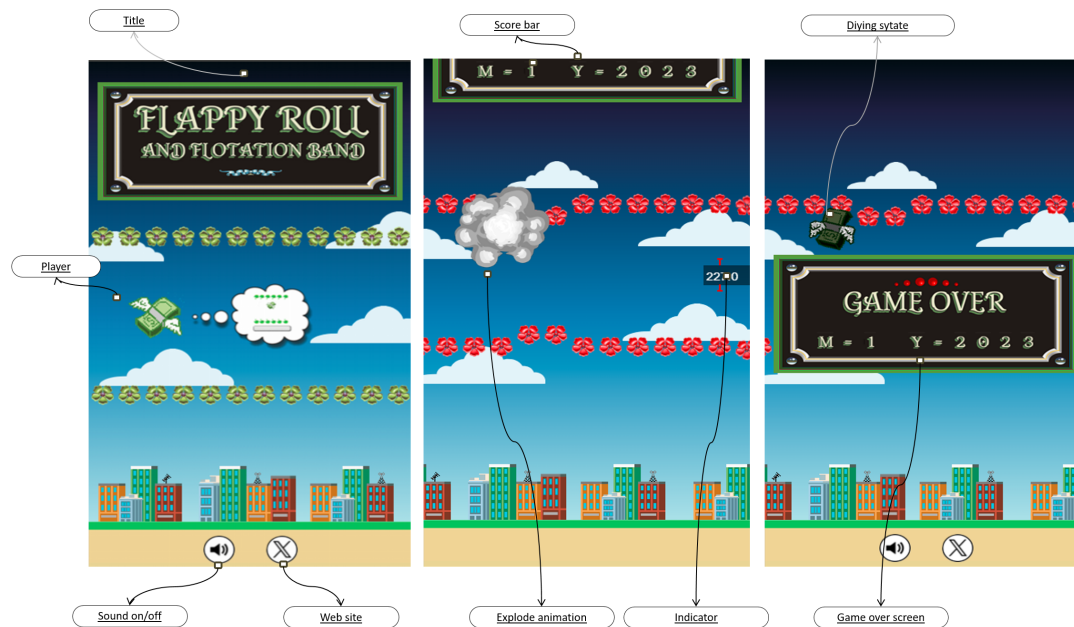

NOTE: n this example we are seeing a picture about one of my previous game but the idea is the same.

Finally, the features map, the idea is that you can see all the features in one picture and use it to estimate the total time to accomplish the development. One of the uses of this picture could be to estimate effort time, counting each feature and multiply by feature time.

Another thing you can do is to make a table with each feature and organize it in order of priority.

FEATURES MAP

Building a new version

No steps must be performed, just modify source code and have fun.

Running locally:

To avoid cross-reference browser constraints, when you try to open index.html just from the file system, you can use "http-server" from NPM (take a look at [NPM http-server](#), download NPM and http-server package if you don't have it).

- Step 1: in root dir type: "http-server" and then enter.
- Step 2: open a browser window and type "localhost:8080".
- PLAN B: download "Web Server for Chrome" plugin and set initial folder to "RiseOfLadybug" in your disk.

Code explanation

I think I will make a tutorial (leitmotiv). There are multiples concepts in this app, for example: mini game framework in javascript, SPA using one only canvas, views, pages, game loop.

References and thanks

- Thanks to Kenny Yip for your videos and the inspiration to create my own version:[KenY Yip web site](#)
- Thanks to David Wehle: [youtube video](#)
